

NYC 311 Complaint Analysis

Annual Report | January – December 2025

Data Source: NYC Open Data – 311 Service Requests

Executive Summary

This report presents a comprehensive analysis of New York City's 311 service request data for the year 2025. The dataset encompasses complaints filed across all five boroughs — Brooklyn, Queens, Bronx, Manhattan, and Staten Island — spanning residential, infrastructure, and quality-of-life concerns.

The analysis reveals consistent monthly complaint volumes hovering near 199,800–199,900 complaints per month, with the notable exception of a dip in mid-year (June–July), before recovering in the second half. Brooklyn generated the highest total complaint volume (704,651), followed by Bronx (559,877), Manhattan (473,349), Queens (372,537), and Staten Island (87,231). Illegal Parking emerged as the single most common complaint type — far outpacing other categories.

Key Findings

1. Monthly Complaint Volume Trend

- Monthly complaints were relatively stable throughout 2025, fluctuating narrowly between ~199,810 and ~199,900.
- A visible decline was recorded in May–June, with the lowest point around June–July (~199,810).
- Volume recovered strongly in August–September, peaking near 199,875, before tapering slightly toward year-end.
- The narrow range of variation suggests systemic, high-volume usage of the 311 service with limited seasonal sensitivity.

2. Borough-Level Distribution

- Brooklyn accounted for the largest share of complaints (~31%), reflecting both its population size and density.
- Bronx had the second highest volume (559,877), which is notable given its relatively smaller geographic footprint compared to Queens.
- Manhattan, despite being the commercial hub, ranked third — likely because many complaints there are routed through other channels.
- Staten Island had the lowest count (87,231), consistent with its comparatively low population density.

3. Top Complaint Types

- Illegal Parking was the top complaint by a significant margin (~370,000+), suggesting persistent parking enforcement gaps.
- Noise – Residential ranked second (~325,000), indicative of dense housing conditions across the city.
- Heat/Hot Water complaints (3rd place, ~225,000) highlight ongoing housing maintenance issues, particularly in winter months.
- Noise-related complaints appeared across three categories (Residential, Street/Sidewalk, Commercial), collectively forming a major cluster of complaints.
- Encampment-related complaints appear in the top 15, reflecting the ongoing challenge of homelessness in public spaces.

Borough Complaint Summary (2025)

Borough	Total Complaints	Share (%)
Brooklyn	704,651	31.3%
Bronx	559,877	24.9%
Queens	372,537	16.5%
Manhattan	473,349	21.0%
Staten Island	87,231	3.9%

Total: 2,197,645 complaints across all boroughs

Recommendations

Parking Enforcement

Given that Illegal Parking is the top complaint city-wide, the city should evaluate targeted enforcement programs, expanded digital permit systems, and redesign of high-frequency violation zones — particularly in Brooklyn and the Bronx.

Noise Abatement

Residential noise remains a persistent quality-of-life challenge. Community-based noise mediation programs and proactive outreach to repeat-offender addresses could help reduce complaint frequency.

Heat & Housing Maintenance

The high volume of Heat/Hot Water complaints warrants increased inspections of residential buildings with repeated violations, especially heading into winter months. A pre-winter audit program could pre-empt a portion of these complaints.

Borough Resource Allocation

Brooklyn and the Bronx together account for over 56% of all complaints. Resource allocation for city services — inspectors, enforcement officers, outreach teams — should be weighted accordingly.

Conclusion

The 2025 NYC 311 complaint data paints a clear picture of the city's most pressing quality-of-life concerns. The data reflects structural challenges — housing quality, traffic management, noise, and homelessness — that require sustained, multi-agency attention.

This analysis can serve as a baseline for year-over-year comparisons and help city planners and policymakers prioritize interventions with the highest potential impact. Continued monitoring of monthly trends, combined with granular neighbourhood-level analysis, will be essential in driving measurable improvement.
